Promoting Argument-Driven Explanation in Earth & Environmental Science

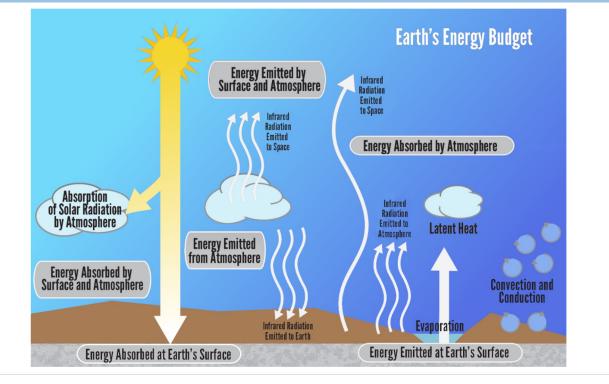

Dr. Donna Governor, UNG Dr. Lorraine Ramirez Villarin, UNG Dr. Missy Holzer, Chatham HS, retired

NSTA 2024 Denver Friday, March 22

8:00 AM - 9:00 AM

Colorado Convention Center -Mile High Ballroom 4C

This research project is supported by the US National Science Foundation (NSF) under Grant Nos. 2201012, 2201015, 2201016, 2201017, 2201018, and 2346657. Any opinions, findings, conclusions, or recommendations expressed are those of the authors and do not necessarily reflect the NSF's views.

Issues in Earth/Environmental Education

Controversial topics of socioscientific relevance:

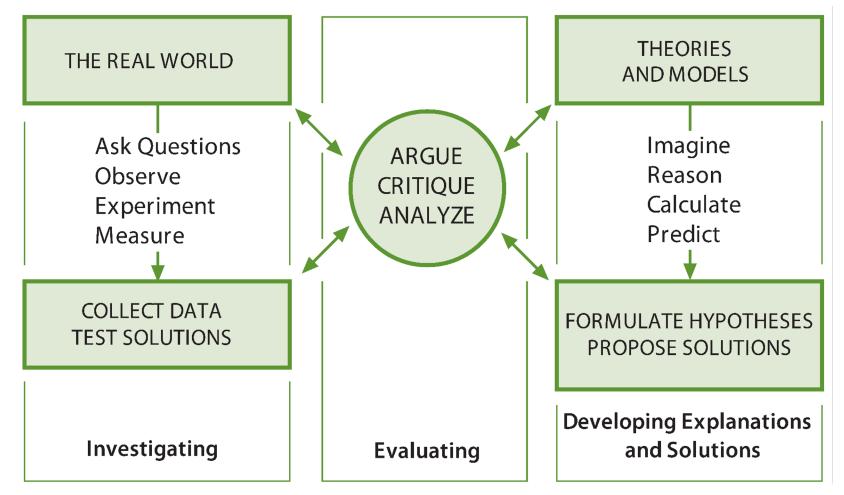

- Climate change
- Fracking
- Extreme Weather
- Freshwater Resources
- Origins of the Universe

Teaching the science alone isn't enough.... We must do more.

If we want to improve scientific literacy, how do we get students to think critically about evidence and make scientific judgments?

Scientific literacy involves knowing both: (1) what scientists know & (2) how scientists know

Evaluation as argument, critique, and analysis is central to scientific thinking and knowledge construction (NRC, 2012)

NGSS/3D Framework Applications

Science & Engineering Practices:

- Engaging in Argument from Evidence
 - Argumentation is seen as essential to scientific discourse because it provides a framework for students to make claims supported by evidence and reasoning related to scientific theory

Driver, R., Newton, P., & Osborne, J. (2000). Establishing the norms of scientific argumentation in classrooms. *Science Education*, *84*(3), 287-312. doi:10.1002/(SICI)1098-237X

3D Framework Applications

Cross Cutting Concepts:

- Cause & Effect
 - Cause and effect relationships may be used to predict phenomena in natural or designed systems.
 - Changes in systems may have various causes that may not have equal effects.

Familiar Instructional Strategies

Claim-Evidence-Reasoning

- Claims: A proposed answer to a question
- Evidence: The information used in an argument to support the claim
- Reasoning: Justification that links the claim and evidence.

Scientists construct MODELS to explain evidence

Claims vs. Models

C		MS	
	_/ \		

MODELS

- An answer to a question
- An assertion based on results of an investigation
- Requires justification to support the claim

- An explanation of a phenomenon
- A hypothesis that leads to new questions
- Predicts or describes how and why a phenomenon occurs

EVIDENCE is the foundation for both claims and models!

More about Models

Models alone are not sufficient to support scientific thinking. <u>Models must be coordinated</u> <u>with lines of evidence</u> to help build an argument about the causes and effects of a particular phenomenon and its systematic relationships.

National Research Council [NRC]. (2012). A framework for K-12 science education: Practices, crosscutting concepts, and core ideas. Washington, DC: The National Academies Press.

More than one model may be an acceptable explanation for the same phenomenon. It is not always possible to exclude all but one model – and also not always desirable. (ex: Dual wave/particle nature of light.)

National Center for Improving Student Learning and Achievement in Mathematics and Science, (2018). Explanatory Models in Science. <u>http://ncisla.wceruw.org/muse/models/index.pdf</u> Accessed 5/22/18

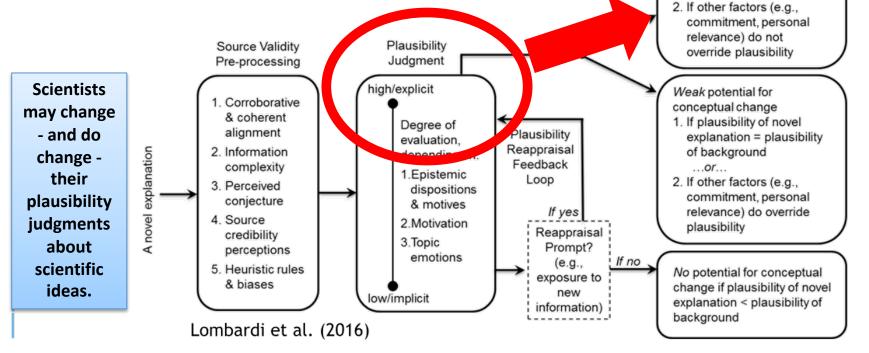

How are scientific models evaluated?

What is Plausibility?

Plausibility is the judgment we make about the truthfulness - or the potential truthfulness - of one model or option compared to another.

The judgment may be tentative, and you do not have to be committed to that judgment decision eternally.

Strong potential for conceptual change 1. If plausibility of novel

of background

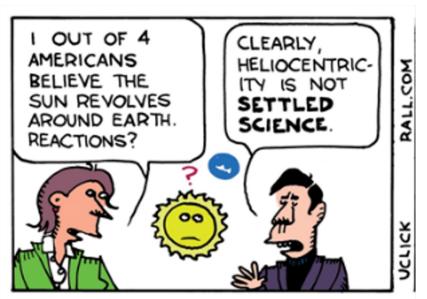

....and....

explanation > plausibility

The Role of Falsifiability in Plausibility Judgements

Scientific ideas must be FALSIFIABLE...

- Scientific ideas can never be proven. But, ideas can be disproven by opposing evidence. When this happens, scientists must revise the idea or come up with another explanation.
- Falsifiability is a very important principle (arguably most important) when evaluating scientific knowledge.

The only consistent characteristic across disciplines is that scientific explanations are open to revision in light of new evidence (NGSS, 2013, Vol 2, p. 96)

Begin by Introducing Students to Plausibility...

NameTeacher_	Period	Date	Carefully read the following paragraph.	
How do scientists chan; Plausibility is a judgment we make about the	nge their plausibility judgmen		Scientific ideas must be <i>falsifiable</i> . In other words, scientific ideas can be disproven by opposing evidence. When this hap or come up with another explanation. <i>Falsifiability</i> is a very	ppens, scientists must revi
another. The judgment may be tentative (not decision.			scientific knowledge.	anato altanti asianti 6a i da

Core Activity: The Model-Evidence Link Diagram

Classroom instruction al scaffolds can help make students' evaluations explicit, thoughtful, & scientific

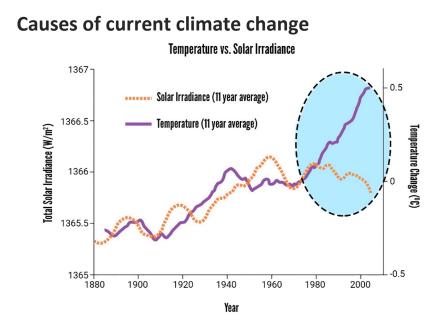

Chinn & colleagues (2012, 2014)

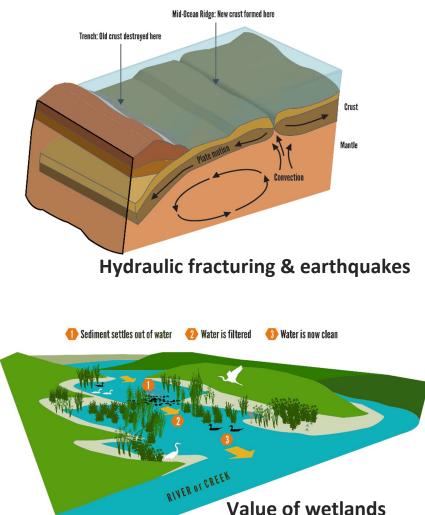

Example of student completed Model-Evidence Link (MEL) diagram

Scientific evaluations may also promote students' reappraisal of their initial plausibility judgments & knowledge reconstruction (Lombardi et al., 2016a)

All MELs are developed to cover concepts in geology, hydrology, climate, and astronomy including...

Formation of the Earth's Moon Moon's orbit is tilted 5° from the ecliptic MOON EARTH Ecliptic: the plane on which most planets orbit around the Sun

MEL Step 1: Rating Plausibility

When teaching the MEL, introduce the explanatory models and have students rate model plausibility Please complete this sheet and feel free to work with a neighbor

Rate Plausibility of Each Model:

- Model A: Climate change is caused by humans who are releasing gases into the atmosphere
- Model B: Climate change is caused by increasing amounts of energy released from the Sun

Please work on this individually. Read the following information carefully. Humans create models to help explain things. Below are two models. These provide different explanations for why global temperatures have increased over the past 100 years and average sea levels have increased over the past 50 years. Model A: Climate change is caused by humans who are releasing gases into the atmosphere A person who supports this model makes the following argument: A few gases in Earth's atmosphere prevent some of Earth's energy from escaping out into space. Human activities are increasing the amount of these gases in the atmosphere. Therefore, humans are causing climate change. Model B: Climate change is caused by increasing amounts of energy released from the Sun A person who supports this model makes the following argument: The Sun is the main source of energy for planet Earth. Scientists have shown that for thousands of years Earth's average temperature increases when the Sun releases more energy. Therefore, the Sun is causing climate change. Plausibility is a judgment we make about the potential truthfulness of one model compared to another. The judgment may be tentative (not certain). You do not have to be committed to that decision. Circle the plausibility of each model. [Make two circles, one for each model.] Creaty	Name:		г	ate:	1	Feacher				Pari	od:

MEL Step 2: Examining the Evidence

Evidence #1: Atmospheric greenhouse gas concentrations have been rising for the past 50 years. Human activities have led to greater releases of greenhouse gases. Temperatures have also been rising during these past 50 years.

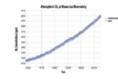

Figure 1. Carlons danish levels is the strangulars Costi: Wright learers The symbol for carbon dioxide in CO₂. These levels have been increasing (Figure 1). CO₂ in the atmosphere absorbs infrared mergy ensited by Earth. People call CO₂ a greenhouse gas because it keeps some of Earth's energy from encaping to space.

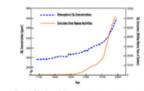

Figure 2. CO, relaxed by human activities. Codit: Wright Summer Figure 2 shows increasing releases of CO2 by the human activity of burning fould fields, including coal, gasoline, natural gas, and wood. Burning fould fields releases CO2 into the atmosphere. Evidence #2: Solar activity has decreased since 1970. Lower activity means that Earth has received less of the Sun's energy. But, Earth's temperature has continued to rise.

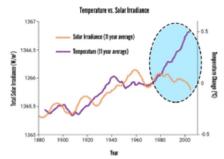

Figure 1. Solar activity levels over time. Credit Wight Summ The Sun's brightness is one way to measure solar activity. In Figure 1, the dashed line shows the Sun's brightness. Since 1970, the Sun's brightness has been decreasing. The solid line on the graph shows Earth's temperature. The graph shows that temperatures are increasing while solar activity is decreasing at the proposation of the dash-dot oval shows where solar activity is decreasing at themperature in increasing.

Evidence 43: Satellites are measuring more of Earth's energy being absorbed by greenhouse gases.

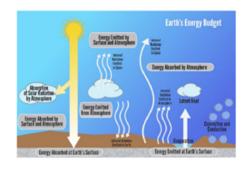

Figure 1. End's many budget. Costs: World senses Figure 1 above shows Earth's energy budget. Earth absorbs about half of the Son's energy. Most of the Son's energy consets to Earth as visible high. Earth resolution this abouthed energy as invisible high called infrared. Some of this infrared energy is abouthed by the stmosphere and sent back to Earth. Some encapes into space. Over time, NASA statibles orbiting Earth have recorded loss infrared energy lewing Earth's atmosphere.

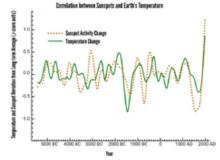

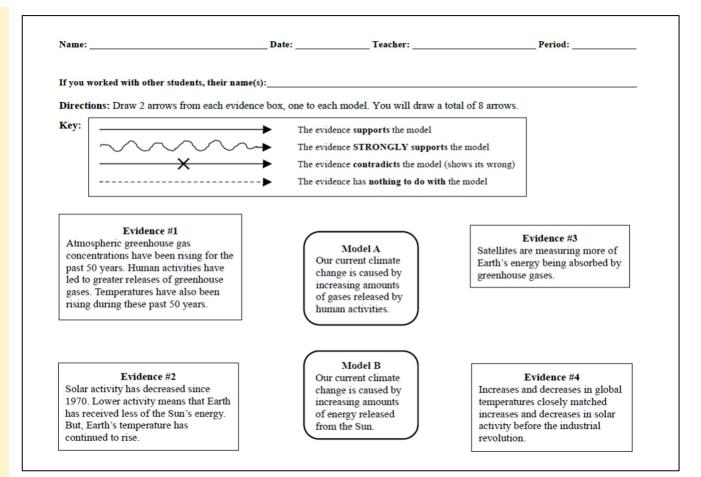

Figure 1. Sumper activity and temperature over time. Code: Wright Senses. In Figure 1, summod activity is the dashed line. Solar activity increases when the Son has more sumports. The solid line shows temperature. The shapes of the sumport and temperature curves match closely. Peaks is the temperature are near peaks in sumspot activity. Dips in temperature are near dips in summode activity.

These data show sumport activity and temperature for the past 9000 years. These data are based on evidence collected from tree rings. Some of the tree rings are from trees that are still living. Some of the trees rings are from ancient trees that have died.

MEL Step 3: Connecting Evidence to Models

Complete the MEL diagram using the evidence texts as a resource

Role of Argumentation & Negotiation

Please complete the diagram and feel free to work with a neighbor

MEL Step 4: Model Re-Evaluation & Explanation

Explain your reasoning

Re-evaluate the
Models using
Evidence-based
reasoning

Name:			Date:		Teach	er:		Perio	od:	
Please work on t	his individua	lly.								
Provide a reason f A. Write the m B. Circle the a C. Write which D. Then write	umber of the e ppropriate wo n model you a	evidence you ord (strongly	1 are writing 7 supports	g about.				0	or import	tant arrows.
1. Evidence #	_ strongly su	upports su	pports co	ntradicts	has nothin	g to do wit	th Model _	becau	ise:	
2. Evidence #	_ strongly su	upports su	pports co	ntradicts	has nothin	g to do wit	th Model _	becau	ise:	
3. Evidence #		upports su	pports co	ntradicts	has nothin	g to do wit	th Model _	becau	ise:	
Circle the plausib	ility of each 1	model. [Mal	ke two circ	les, one for	r each mod	lel.]				
	Greatly implausibl or even impossible									Highly plausible
Model A	1	2	3	4	5	6	7	8	9	10
Model B	1	2	3	4	5	6	7	8	9	10
Climate Change MEL	Explanation Task	(08/02/2015)								Page 1 of 1

Evaluating the Explanation Task

Provide a reason for three of the arrows you have drawn. Write your reasons for the three most interesting or important arrows.

- A. Write the number of the evidence you are writing about.
- B. Circle the appropriate word (strongly supports | supports | contradicts | has nothing to do with).
- C. Write which model you are writing about.
- D. Then write your reason.

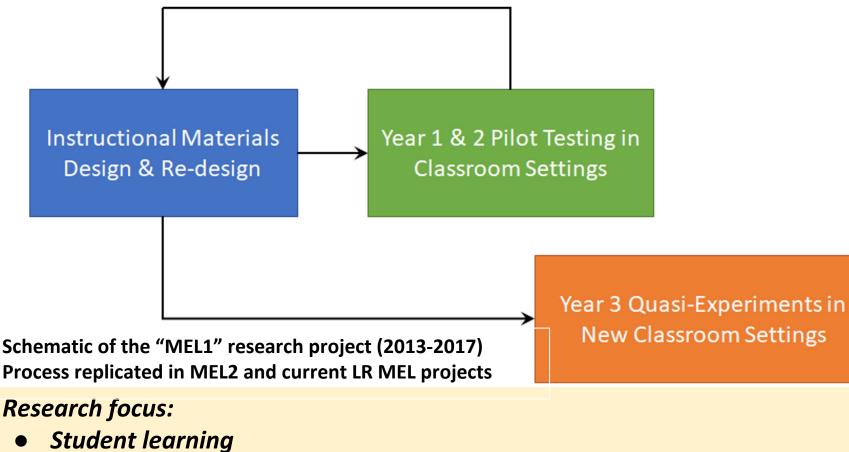

1. Evidence # 1 strongly supports | supports | contradicts | has nothing to do with Model A because: Evidence 1 says that human activities have lead to greater releases of greenhouse gases, which have been vising for the past so years. This strangly supports Model A because it is explaining that our climate change is being caused by human activities.

2. Evidence # 1 strongly supports | supports | contradicts | has nothing to do with Model B because: Evidence 1 contradict Model B because evidence one says that human activities have led to greater releases of greenhouse gases, while model B says that increasing amounts of energy from the sun is what is causing climate change.

3. Evidence # 2 strongly supports | supports contradices | has nothing to do with Model B because: Evidence 24 contridents Model B because evidence D says that Earth has recircued less of the suns energy, and mode B says the opposite, that chimate change has been caused by increasing amounts of energy from the scin.

Evaluate students claims using evidence-based reasoning

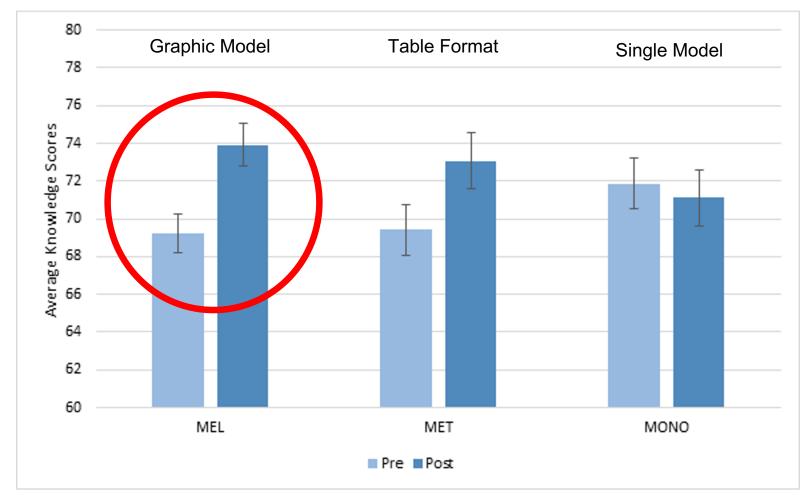

Research Process: Investigating Students' evaluations, plausibility & understanding of Earth & Environmental Science Topics

- Argumentation
- Shifts in Plausibility understanding scientific models and evidence

Explanations Deepen Student Learning!

The MEL activities result in ~1 letter grade increase in knowledge

Our research shows that students make scientific evaluations and learn about these topics more deeply

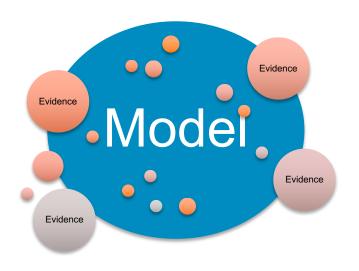

But we were unsatisfied, because some students were not transferring their evaluative thinking outside of the classroom context

pcMELs vs. baMELs

pcMELs

- Two models
- Four lines of evidence

baMELS

- Three models
- Eight (or more) lines of evidence

All baMELs have a pcMEL version

baMELs: Topics

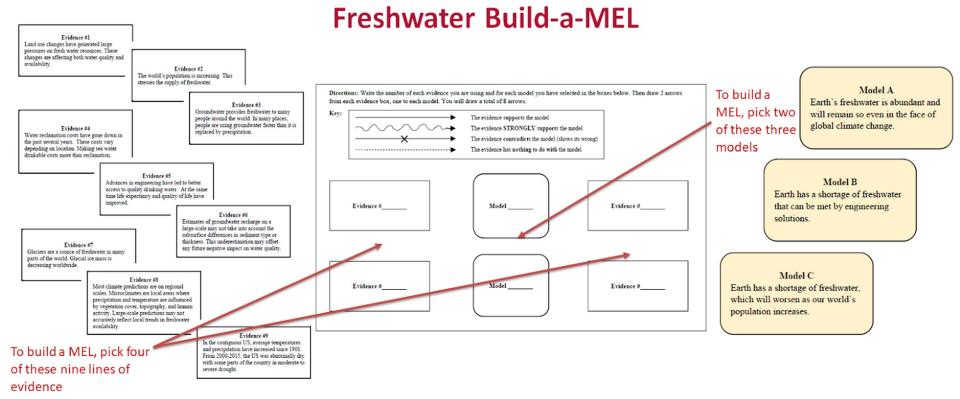

- Topics:
 - Fossils
 - Origins
 - Extreme Wx
 - Freshwater

Try some of these out!

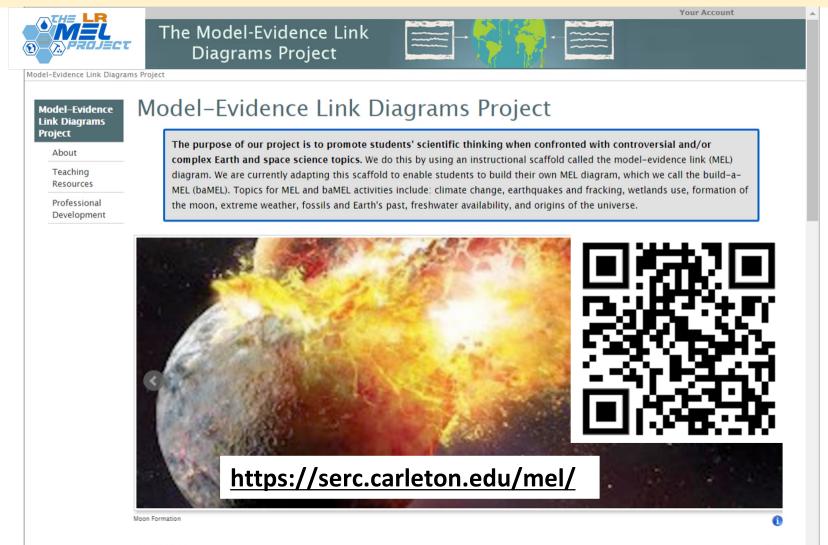

baMELs: Scaffolds that Increase Students' "conceptual agency"

Students who exercise conceptual agency are authors of their own contributions, accountable to the classroom learning community, and have the authority to think about and solve problems (Nussbaum & Asterhan, 2016)

Please visit the MEL project website for free access to all our instructional materials and resources

New Project! Integrating Lateral Reading Strategies for Understanding Socioscientific Issues

Source Evaluation

Collaborative Argumentation

> Critical Thinking

2024 GEORGIA SUMMER INSTITUTE Teaching Students to Evaluate Sources and Claims

June 3 - 6, 2024

Forsyth County Board of Education 1120 Dahlonega Hwy Cumming, GA 30040

This 3.5-day institute for middle and high school teachers will explore and connect two types of curricular materials that deepen students' understanding of how to evaluate socioscientific issues, such as the climate crisis, energy use, and food security, using instructional scaffolds called *Lateral Reading* and *Model-Evidence Link Diagrams* (LR-MEL).

\$900 STIPEND: After attending the two pre-institute webinars (May 6 and 20) and the summer institute.

Applications that include teams of 1 science teacher AND 1 social studies OR ELA teacher will be given priority for the institute, but solo applications from any of these areas are also welcome. Access the application using the QR Code below or https://forms.gle/ohPpxdGXU5UNDNyE6

Application

Deadline April 1, 2024

Email questions to: **mel2institutes@gmail.com**

• Science + ELA or SS

Forsyth County Georgia

- June 3-6, 2024
- Philadelphia, PA
- June 24-27, 2024

Stipends:

- \$900 each
- Additional compensation for follow up seminar

Questions & Comments?

Thanks so much for attending!
